Prof. Rosicar Escobar

Project Overview

FlashMind is an online study app designed to help students and learners remember information effectively. The app allows users to create, organize, and review flashcards with the help of artificial intelligence. AI will assist by generating flashcards, tracking progress, and suggesting improvements to optimize learning.

Problem Statement

Many students struggle with memorization and efficient study habits. Traditional flashcards can be time-consuming to create, and users may not always know the best way to structure their learning. This app solves these problems by using AI to generate flashcards and help memorization, making learning more effective and less stressful.

Notable Usefulness

Key Features

- **Flashcard Creation:** Users can manually create flashcards with text, images, and hints.
- **AI-Generated Flashcards:** AI suggests flashcards based on input text, topics, or uploaded documents.
- **AI-Powered Summarization:** Extract key points from large text and create flashcards.
- **Voice Input & Text-to-Speech:** Users can speak to create flashcards, and AI can read flashcards aloud.
- **User Authentication:** Secure sign-up/login using email or third-party authentication.

Value Proposition

FlashMind helps people by making studying faster, easier, and more efficient. Instead of spending hours making flashcards, users can focus on learning while AI handles the rest. The app also tracks progress and provides smart suggestions to improve memory retention.

Innovation

Unique Aspects

- AI-powered flashcard generation saves time.
- Voice input makes flashcard creation easier.
- Text-to-speech helps auditory learners.
- Using React.js and Tailwind CSS creates a responsive and visually appealing user interface that works on different devices.
- Using Node.js with Express.js seamlessly communicate the app and the server.

Emerging Technology Used

- Artificial Intelligence for generating and summarizing content.
- Cloud Storage to save and sync flashcards across devices.
- Speech Recognition for voice input.
- React.js for Frontend Development
- Node.js + Express.js for Backend Development

Beneficiaries

Target Audience

- Students of all ages
- Professionals preparing for exams or certifications
- Anyone who wants to improve memory and learning skills

Impact

- Saves time by automating flashcard creation.
- Improves memory with AI-powered study techniques.
- Makes learning more engaging with voice and text-to-speech features.

Timeline

Project Phases

- **Phase 1:** Research & Planning (1 Week) – Define features and design app flow.
- **Phase 2:** Design & Prototyping (1 Week) – Create wireframes and initial layout.
- **Phase 3:** Backend Development (1 Week) – Set up APIs and data storage.
- **Phase 4:** Frontend Development (2 Weeks) – Implement UI and integrate APIs.
- **Phase 5:** Testing & Debugging (1 Week) – Identify and fix bugs, improve performance.

- **Phase 6:** Deployment & Submission (1 Week) – Final testing, documentation, and launch.

Milestones

- **Week 1:** Complete research and application requirements.
- **Week 2-3:** Finalize design and deliver prototype.
- **Week 4-5:** Core system features fully developed.
- **Week 6:** Finish Testing and polish the application.
- **Week 7:** Deploy FlashMind and submit documentation.

Budget

Estimated Costs

- Frontend & Backend Development: Free (using React.js, Node.js, Express.js)
- Database (Firebase, SQLite): Free (using Firebase free tier and local SQLite storage)
- AI Integration: Free (limited usage)
- Deployment (Railway or MonsterASP.NET): Free (starter plan) or PHP 500 (if upgraded)
- Testing Devices: Will be tested using personal devices

Total Budget:

Estimated Total: PHP 0 - PHP 500 (depending on deployment options)

Technology Stack (Tentative)

Tools and Technologies

- Frontend: React.js
- Backend: Node.js + Express.js
- Database/Storage: Firebase, SQLite
- AI Tools: Open-source AI models such as GPT-2, T5, or BERT (via Hugging Face API) for flashcard generation and summarization
- Speech Recognition & TTS: Google Cloud Speech-to-Text and Text-to-Speech

Justification

- React.js provides a fast and efficient user interface.
- Node.js + Express.js offer a strong backend for AI processing and API integration.
- Firebase enables secure storage and real-time sync.
- Open-source AI models reduce costs while providing AI-powered features.

Conclusion

Summary

FlashMind AI is an AI-powered study tool that helps users create, organize, and review flashcards easily. By automating flashcard generation, the app makes

learning more effective and stress-free. It is designed for students, professionals, and anyone looking to improve their memory and study habits.

Next Steps

- **Begin Phase 1: Research & Planning** Define features, user requirements, design app flow, research suitable AI APIs, and finalize the system's core features.
- **Design & Prototyping:** Start creating wireframes and testing basic UI interactions to gather early feedback for improvements.
